

## New IP67 protective caps for M17 connectors

Protective caps are available to protect the contact elements on connectors when in an unlocked state.

New additions to the product range are metal protective caps for M17 signal and power connectors with external thread. When screwed and locked these offer IP67 protection. The ingress of dirt and moisture into the connectors is thereby prevented in a reliable manner.

A version with steel wire and fastening eye is available for the equipment side. The wire is secured in place with the fastening screws and prevents the metal protective cap from being lost.

Ordering information can be found in the table below.
